Proc. R. Soc. Lond., B. Biol. Sci. 259:7-14(1995).
--- FUNCTION: PROTAMINES SUBSTITUTES FOR HISTONES IN THE CHROMATIN OF
SPERM DURING THE HAPLOID PHASE OF SPERMATOGENESIS. THEY COMPACT
SPERM DIA INTO A HIGHLY CONDENSED, STABLE AND INACTIVE COMPLEX.
--- SÜBCELLULAR LOCATION: NUCLEAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AMIDATION (G-149 PROVIDE AMIDE GROUP)

                                                                                                                                                                                                                                                                                                                                                 ô
                        This peptide represents a linear derivative of the tachyplesin family of peptide antibiotics. Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivitals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to cytoplasm and nucleus, including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a pharmaceutical composition, which comprises at least one anticancer agent associated with at least one peptide that can transport it into cancer cells and which inhibits development of resistance to the anticancer agent. By using the peptide as a vector for delivery of the anticancer agent, machanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition useful for cancer treatment and prevention, contains enticancer agent and peptide vector that transports agent into cells

Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivitatals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                       Linear; tachyplesin; peptide antibiotic; beta-sheet; secondary structure; disulphide bridge; antibody; ribozyme; antitumour agent; antiviral; anti-inflammatory; mammal; cell membrane; passive transport; cytoplasm; nucleus; blood-brain barrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Derivatives of antibiotic peptides lacking disulfide bridges \, used as carriers to deliver active agents into cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Sequences AAV69610-Y69611 and AAV69617 represent tachyplesin analogues
used in an exemplification of the present invention, in which the
contains tachyplesin cysteine residues are replaced with Ala, Leu and
Asp, respectively. Tachyplesin (AAV69608) is a naturally occurring
antimicrobial peptide which contains two disulphide bonds which help
comming the reflary structure. The invention relates to novel
peptide analogues of tachyplesin (Y696912-AAX69614, AAX69616) in which
the cysteine residues at positions 3, 7, 12 and 16 of the native
the cysteine replaced by the hydrophobic amino acids isoleucine,
actoryplesin are replaced by the hydrophobic amino acids isoleucine,
the same maino acid being
present at all four positions. Despite being unable to form
intramolecular disulphide bonds, the analogues are functional as
antimicrobial agents. The tachyplesin analogues are seful for
controlling fungal and viral activity in agricultural and medical
applications and for controlling plant viruses. They can also be
cypressed in transgenic plants, preferably wheat, sorghum, sunflower,
soya or especially maize plants, preferably wheat, sorghum, sunflower,
soya or especially maize plants to provide resistance to pathogenic fungi
                                                                                                                                                                                                                                                                                               New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 79; DB 21; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium araminearum, Fusarium monliforme, Sclerctinia sclerotiorum, Sclerctinia trifoliorum and Aspergilus flavus. The peptides can also be used for treating and preventing infection in humans and

/note= "The molecule has the same amino acid at all four
  of the above positions"
                                                                                                                                         AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

This sequence represents a generic tachyplesin (TP) analogue which has antimicrobial activity. Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disuplande bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAY69614, AAY69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isoleucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical expressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants, to provide resistance to pathogenic fungi
                                                                                                                                                                                                    New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tachyplesin analogue; generic; antimicrobial; disulphide bond; antifungal; antiviral; antimicrobial; transgenic plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 75; DB 21; Length 17;

                                                                                                                                                                                                                                                                                                                                                                                                                                                               8 × 0 0 0 0 0 0 0 0 0 0 × 0
                                                                                                                                                                                                                                                                                                                           ð
                                                                                                                            Sequences AAY69610-Y69611 and AAY69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala, Leu and Asp, respectively. Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y66912-AAY66014, AAY66016) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isoleucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be controlling maize plants to provide resistance to pathogenic funging and viruses. Note: The present sequence is not shown in the sequence given in column 23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemcoytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium moniforme, Sclerotinia sclerotionum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Evsarium monilforme, Sclarottinia sclerotiorum, Sclerottinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab hoemcoytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and animals.
                                                                                                                                                                                                                                                                                           New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inhibitor; antimicrobial; plant pathogen; fungi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab hosemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monificame, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

The lipopolysaccharide-binding polypeptides may be prepd. by either solid-phase peptide synthesis followed by oxidn. to form the disulphide bridges or, subjecting horseshoe crab haemocytes to hypotonic extraction, extracting the residue with acid, and purifying the extract. The polypeptides have high affinity for lipopolysaccharide (LPS) endotoxins and are useful for removing such toxins from fluids, as antibacterial agents, eg active against Salmonella spp. and S. aureus, and for trachobronchial infections, urhary tract infections, bedsores, burns, complications.
                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                         AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monliforme, Sclerothina sclerotiorum, Sclerothina trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

Sequence 9, Application US/08168809
Patent No. 5580852
GENERAL INFORMATION:
APPLICANT: Putnam, Rebecca J.
APPLICANT: Rao, Aragula G.
TITLE JF INVENTION: DERIVATIVES OF TACHYPLESIN HAVING
TITLE JF INVENTION: INTIBITORY ACTIVITY TOWARDS PLANT PATHOGENIC FUNGINUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ploneer Hi-Bred International
STREET: 700 Capital Square, 400 Locust Stree

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1, Application US/08962034
Patent No. 6015941
GENERAL INFORMATION:
APPLICANT: RAO, A. GUTURAJ
TITLE OF INVENTION: PEPTIDE DERIVATIVES OF TACHYPLESIN
TITLE OF INVENTION: HAVING ANTIMICROBIAL ACTIVITY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 E: Bell Seltzer IP Group of Alston & Bird 3605 Glenwood Ave.

A; Title: DNA Sequence of both chromosomes of the cholera pathogen Vibrio cholerae.
A; Reference number: A82035; MUID:20406833
A; Accession: CB2472
A; Status: preliminary
A; Molecule type: DNA
A; Realdues: 1-88 cHEI>
A; Cross-references: GB:AE004372; GB:AE003853; NID:q9657741; PIDN:AAF96240.1; GSPDB:GN001
A; Experimental source: serogroup 01; strain N16961; biotype El Tor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Publication of the protein AAG27097.1 [imported] - Arabidopsis thaliana because the protein AAG27097.1 [imported] - Arabidopsis thaliana (mouse-ear cress)
C:Species: Arabidopsis thaliana (mouse-ear cress)
C:Date: 02-Mar-2001 #sequence_revision 02-Mar-2001 #text_change 31-Mar-2001
C:Accession: D86473

hypothetical protein At2938500 [imported] - Arabidopsis thaliana
N;Alternate names: hypothetical protein T19C21.1
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Date: 05-Mar-1999 #sequence_revision 05-Mar-1999 #text_change 16-Feb-2001
C;Accession: T02495; G84805
R;Rounsley, S.D.; Lin, X.; Ketchum, K.A.; Crosby, M.L.; Brandon, R.C.; Sykes, S.M.; submitted to the EMBL Data Library, August 1998
A;Description: Arabidopsis thaliana chromosome II BAC T19C21 genomic sequence.
A;Reference number: 214676

-!- FUNCTION: TYROSINE KINASE OF THE NON-RECEPTOR TYPE, INVOLVED IN THE INTERLEUKIN-2 AND INTERLEUKIN-4 SIGNALING PATHWAY.

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.

-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PHOSPHATE.

-!- SUBCELLUIAR LOCATION: WHOLLY INTRACELLULAR, POSSIBLY MEMBRANE ASSOCIATED (BY SIMILARITY).

-!- TISSUE SPECIFICITY: TRANSCRIBED IN A VARIETY OF TISSUES INCLUDING SPLEEN, LUNG, KINDEX AND INTESTINE PROBABLY CONTAINS THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-NOV-1997 (Rel. 35, Created)

                                                                                                                                                                                     1 TISSUE SPECIFICATION TESTINE CONTAINING
INTESTINE AND TESTINE
1 DOMAIN: CONTAINS A CENTRAL DOMAIN (SUBSTRATE DOMAIN) CONTAINING
MULTIPLE POTENTIAL SH2-BINDING SITES AND A C-TERMINAL DOMAIN
CONTAINING A DIVERGENT HELLX-LOOP-HELIX (HLH) MOTIF. THE SH2-
CONTAINING SITES PUTATIVELY BIND CRX, NCK AND ABL SH2 DOMAINS. THE
BINDING SITES PUTATIVELY BIND CRX, NCK AND ABL SH2 DOMAINS. THE
HLH MOTIF IS ABSOLUTELY REQUIRED FOR THE INDUCTION OF PSEUDOHYPHAL
GROWTH IN YEAST AND MEDIATES HETERODIMERIZATION WITH CASL.
1- DOMAIN: A SERINE-RICH REGION PROMOTES ACTIVATION OF THE SERUM
RESPONSE BLEMENT (SRE).
1- PTH: FOCAL ADHESION KINASE 1 PHOSPHORYLATES THE PROTEIN AT THE
YDYNHL MOTIF. THE SRC FAMILY KINASES ARE RECRITED TO THE
PHOSPHORYLATED SITES AND CAN PHOSPHORYLATE OTHER TYROSINE
RESIDUES. TYROSINE PHOSPHORYLATION IS TRIGGERED BY INTEGRIN
MEDIATED ADHESION OF CELLS TO THE EXTRACELLURAR MATRIX.
1- DISEASE: APPEARS TO HAVE A CENTRAL FUNCTION IN TRANSFORMATION OF
SOME CELL TYPES.
1- SIMILARITY: CONTAINS 1 SH3 DOMAIN. NECESSARY FOR THE LOCALISATION
OF THE PROTEIN TO FOCAL ADHESION SAND INTERACTS WITH ONE PROLINE-
RICH REGION OF FOCAL ADHESION KINASE 1.
2 IMPLARITY: CONTAINS 1 SH3-BINDING DOMAIN. THE SH3 BINDING DOMAIN
